# THE DETERMINATION OF UNKNOWN THERMAL COEFFICIENTS THROUGH PHASE CHANGE PROCESS WITH TEMPERATURE-DEPENDENT THERMAL CONDUCTIVITY 

Domingo A. Tarzia<br>Depto. de Matemática, FCE, Universidad Austral,<br>Paraguay 1950, 2000 Rosario, Argentina

(Communicated by J.P. Hartnett and W.J. Minkowycz)

#### Abstract

We study the determination of unknown thermal coefficient of a semi-infinite material through a phase-change process with an overspecified condition on the fixed face with temperature-dependent thermal conductivity. We determine necessary and sufficient conditions on data in order to obtain the existence of the solution. We also give formulae for the unknown coefficients. © 1998 Elsevier Science Ltd

## Introduction

Heat transfer problems with phase-change such as melting and freezing have been studied in the last century due to their wide scientific and technological applications. For example, a review of a long bibliography on moving and free boundary problems for the heat equation, particularly concerning the Stefan problem, is presented in [8] with a large bibliography.

We consider the following solidification problem for a semi-infinite material with an overspecified condition on the fixed face $[1,3,4,6]$ :

$$
\begin{align*}
& \rho \mathrm{c} \mathrm{~T}_{\mathrm{t}}=\left(\mathrm{k}(\mathrm{~T}) \mathrm{T}_{\mathrm{x}}\right)_{\mathrm{x}}, \quad 0<\mathrm{x}<\mathrm{s}(\mathrm{t}), \mathrm{t}>0, \\
& \mathrm{~s}(0)=0, \\
& \mathrm{~T}(0, \mathrm{t})=\mathrm{T}_{\mathrm{o}}<\mathrm{T}_{\mathrm{f}}, \mathrm{t}>0, \\
& \mathrm{~T}(\mathrm{~s}(\mathrm{t}), \mathrm{t})=\mathrm{T}_{\mathrm{f}}, \mathrm{t}>0,  \tag{1}\\
& \mathrm{k}\left(\mathrm{~T}_{\mathrm{f}}\right) \mathrm{T}_{\mathrm{x}}(\mathrm{~s}(\mathrm{t}), \mathrm{t})=\rho \mathrm{h} \dot{\mathrm{~s}(\mathrm{t}), \mathrm{t}>0,} \\
& \mathrm{k}\left(\mathrm{~T}_{\mathrm{o}}\right) \mathrm{T}_{\mathrm{x}}(0, \mathrm{t})=\frac{\mathrm{q}_{\mathrm{o}}}{\sqrt{\mathrm{t}}}, \mathrm{t}>0,
\end{align*}
$$

where $T=T(x, t)$ is the temperature of the solid phase, $\rho>0$ is the density of mass, $h>0$ is the latent heat of fusion by unity of mass, $c>0$ is the specific heat, $x=s(t)$ is the phase-change interface, $T_{f}$ is the phase-change temperature ( $\mathrm{T}_{\mathrm{o}}$ is a reference temperature), $\mathrm{k}=\mathrm{k}(\mathrm{T})=\mathrm{k}_{\mathrm{o}}\left[1+\beta\left(\mathrm{T}-\mathrm{T}_{\mathrm{o}}\right) /\left(\mathrm{T}_{\mathrm{f}}-\mathrm{T}_{\mathrm{o}}\right)\right][5,7]$ is the thermal conductivity, $\alpha_{\mathrm{o}}=\mathrm{k}_{\mathrm{o}} / \rho \mathrm{c}$ is the diffusion coefficient to the reference temperature $\mathrm{T}=\mathrm{T}_{\mathrm{o}}$, and coefficients $\beta>0, \mathrm{q}_{0}>0$.

The phase-change process with temperature dependent thermal conductivity was firstly studied in [5]. In [9, 10] one or two thermal coefficients for the case $k=k_{0}$ (i.e. $\beta \equiv 0$ ) were determined, and formulae for the unknown coefficients were given.

The goal of the present paper is to consider the general case $\beta \neq 0$. The problem consists in finding $\beta$ and two other unknown elements among $k_{0}, c, \rho, h$ and $s(t)$. Moreover, the coefficients $q_{0}>0$ (which characterizes the heat flux at the fixed face $x=0$ ) and $T_{o}>0$ (which is the temperature at the fixed face $\mathrm{x}=0$ ) must be found through the experimental phase-change process [2].

The solution is given by :

$$
\begin{align*}
& \mathrm{T}(\mathrm{x}, \mathrm{t})=\mathrm{T}_{\mathrm{o}}+\left(\mathrm{T}_{\mathrm{f}}-\mathrm{T}_{\mathrm{o}}\right) \Phi_{\delta}(\eta)  \tag{2}\\
& \mathrm{\Phi}(\mathrm{t})=2 \sigma \sqrt{\mathrm{t}}=2 \lambda \sqrt{\boldsymbol{\Phi}_{\mathrm{o}}^{\mathrm{t}}}, \quad \eta=\frac{\mathrm{x}}{2 \sqrt{\alpha_{\mathrm{o}}^{\mathrm{t}}}}(\text { with } \delta>-1), 0<\eta<\lambda \sqrt{\alpha_{\mathrm{o}}}=\lambda \sqrt{\frac{\mathrm{k}_{\mathrm{o}}}{\rho \mathrm{c}}}, \tag{3}
\end{align*}
$$

where the unknown coefficients must satisfy the following system of equations:

$$
\begin{align*}
& \beta=\delta \Phi_{\delta}(\lambda),  \tag{4}\\
& {\left[1+\delta \Phi_{\delta}(\lambda)\right] \frac{\Phi_{\delta}^{\prime}(\lambda)}{\lambda \Phi_{\delta}(\lambda)}=\frac{2}{\text { Ste }},}  \tag{5}\\
& \frac{\Phi_{\delta}^{\prime}(0)}{\Phi_{\delta}(\lambda)}=\frac{2 \mathrm{q}_{\mathrm{o}}}{\left(\mathrm{~T}_{\mathrm{f}}-\mathrm{T}_{\mathrm{o}}\right) \sqrt{\mathrm{k}_{\mathrm{o}} \rho \mathrm{c}}} \tag{6}
\end{align*}
$$

where Ste $=\frac{\mathbf{c}\left(\mathrm{T}_{\mathrm{f}}-\mathrm{T}_{0}\right)}{\mathrm{h}}>0$ is the Stefan number and $\Phi=\Phi_{\delta}=\Phi_{\delta}(\mathbf{x})$ is the error modified function which is the unique solution of the following value boundary problem :

$$
\begin{align*}
& {\left[(1+\delta \mathrm{y}(\mathrm{x})) \mathrm{y}^{\prime}(\mathrm{x})\right]^{\prime}+2 \mathrm{x}^{\prime}(\mathrm{x})=0} \\
& \mathrm{y}\left(0^{+}\right)=0, \mathrm{y}(+\infty)=1 \tag{7}
\end{align*}
$$

From now on we suppose that $\delta>-1$ is a given real number. Function $\Phi$ verifies the following conditions

$$
\begin{equation*}
\Phi\left(0^{+}\right)=0, \Phi(+\infty)=1, \Phi^{\prime}>0 \text { and } \Phi^{\prime \prime}<0 \tag{8}
\end{equation*}
$$

For $\delta=0$, function $\boldsymbol{\Phi}=\boldsymbol{\Phi}_{\mathrm{O}}$ is the classical error function given by

$$
\begin{equation*}
\Phi_{\mathrm{o}}(\mathrm{x})=\operatorname{erf}(\mathrm{x})=\frac{2}{\sqrt{\pi}} \int_{0}^{\mathrm{x}} \exp \left(-\mathrm{u}^{2}\right) \mathrm{du} \tag{9}
\end{equation*}
$$

which was utilized in $[9,10]$ for the determination of unknown thermal coefficients.
The experimental determination of the coefficients $\mathrm{q}_{\mathrm{O}}>0$ and $\sigma>0$ (when necessary) can be obtained respectively through the least squares in the following expressions :

$$
q_{0}=t^{1 / 2} k\left(T_{o}\right) T_{x}(0, t)\left(t^{1 / 2} \text { times heat flux in } x=0 \text { at time } t\right) \text { for all } t>0,
$$

$$
\sigma=\frac{\mathrm{s}(\mathrm{t})}{2 \mathrm{t}^{1 / 2}}, \quad \text { for all } \mathrm{t}>0
$$

through a discrete number of measurement at time $t_{1}, t_{2}, \ldots, t_{n}$ of the corresponding quantities. In [2] this method was indicated in order to apply the formulae obtained in [9, 10].

We shall give necessary and sufficient conditions to obtain a solution of the above type (2), (3) and we also give formulae for the unknown thermal coefficients in ten different cases:

Case 1: Determination of the unknown coefficients $\beta, \lambda, \mathbf{k}_{\mathrm{o}}$;
Case 2: Determination of the unknown coefficients $\beta, \lambda, \rho$;
Case 3 : Determination of the unknown coefficients $\beta, \lambda, \mathbf{h}$;
Case 4: Determination of the unknown coefficients $\beta, \lambda, \mathbf{c}$;
Case 5: Determination of the unknown coefficients $\beta, \rho, \mathbf{k}_{\mathbf{o}}$;
Case 6: Determination of the unknown coefficients $\beta, \mathrm{c}, \mathrm{k}_{\mathrm{o}}$;
Case 7: Determination of the unknown coefficients $\beta, \mathrm{h}, \mathrm{k}_{\mathrm{o}}$;
Case 8: Determination of the unknown coefficients $\beta, \rho, \mathrm{c}$;
Case 9 : Determination of the unknown coefficients $\beta, \rho, \mathrm{h}$;
Case 10 : Determination of the unknown coefficients $\beta, \mathrm{c}, \mathrm{h}$.
We remark that cases 1 to 4 correspond to a free boundary problem (the phase-change interface, i.e. coefficient $\lambda$, is unknown) and cases 5 to 10 correspond to a moving boundary problem (the phase-change interface is given by $\mathrm{s}(\mathrm{t})=2 \sigma \sqrt{\mathrm{t}}$ with $\sigma>0[6,8])$.

In order to give, case by case, the formulae for the unknown thermal coefficients and the restriction for the data to obtain the solution of the corresponding problem, let us consider the following restrictions (which can be considered as the necessary and sufficient condition for the existence and uniqueness of the solution for some particular cases) :

$$
\begin{align*}
& \frac{\left(\mathrm{T}_{\mathrm{f}}-\mathrm{T}_{\mathrm{o}}\right)}{2 \mathrm{q}_{\mathrm{o}}} \Phi^{\prime}(0) \sqrt{\rho \mathrm{ck}_{\mathrm{o}}}<1  \tag{1}\\
& \frac{\rho \mathrm{hk}_{\mathrm{o}}\left(\mathrm{~T}_{\mathrm{f}}-\mathrm{T}_{\mathrm{o}}\right)}{2 \mathrm{q}_{\mathrm{o}}^{2}}<1  \tag{2}\\
& \frac{\rho \mathrm{~h} \sigma}{\mathrm{q}_{\mathrm{o}}}<1  \tag{3}\\
& \frac{\mathrm{k}_{\mathrm{o}}\left(\mathrm{~T}_{\mathrm{f}}-\mathrm{T}_{\mathrm{o}}\right)}{2 \sigma \mathrm{q}_{o}}<1 \tag{4}
\end{align*}
$$

We also consider the following six functions, defined by $\mathrm{x}>0$ :

$$
\begin{array}{lll}
\mathrm{F}_{1}(\mathrm{x})=1+\delta \Phi(\mathrm{x}), & \mathrm{F}_{2}(\mathrm{x})=\frac{\mathrm{x} \Phi(\mathrm{x})}{\Phi^{\prime}(\mathrm{x})}, & \mathrm{F}_{3}(\mathrm{x})=[1+\delta \Phi(\mathrm{x})] \Phi^{\prime}(\mathrm{x}) \\
\mathrm{F}_{4}(\mathrm{x})=\mathrm{x} \Phi(\mathrm{x}), & \mathrm{F}_{5}(\mathrm{x})=\frac{\Phi(\mathrm{x})}{\mathrm{x}}, & \mathrm{~F}_{6}(\mathrm{x})=\frac{\mathrm{x}}{\Phi(\mathrm{x})}=\frac{1}{\mathrm{~F}_{5}(\mathrm{x})} \tag{10}
\end{array}
$$

which satisfy the following properties :

$$
\begin{aligned}
& \mathrm{F}_{1}\left(0^{+}\right)=1, \quad \mathrm{~F}_{1}(+\infty)=1+\delta, \quad \mathrm{F}_{1}^{\prime}>0 \text { for } \delta>0 \text { and } \mathrm{F}_{1}^{\prime}<0 \text { for }-1<\delta<0, \\
& \mathrm{~F}_{2}\left(0^{+}\right)=0, \mathrm{~F}_{2}(+\infty)=+\infty, \mathrm{F}_{2}^{\prime}>0 ; \quad \mathrm{F}_{3}\left(0^{+}\right)=\Phi^{\prime}(0)>0, \mathrm{~F}_{3}(+\infty)=0, \mathrm{~F}_{3}^{\prime}<0, \\
& \mathrm{~F}_{4}\left(0^{+}\right)=0, \mathrm{~F}_{4}(+\infty)=+\infty, \mathrm{F}_{4}^{\prime}>0 ; \quad \mathrm{F}_{5}\left(0^{+}\right)=\Phi^{\prime}(0)>0, \mathrm{~F}_{5}(+\infty)=0, \mathrm{~F}_{5}^{\prime}<0, \\
& \mathrm{~F}_{6}(0)=\frac{1}{\Phi^{\prime}(0)}>0, \mathrm{~F}_{6}(+\infty)=+\infty, \mathrm{F}_{6}^{\prime}>0 .
\end{aligned}
$$

## Solution

Now we shall only prove the following properties corresponding to cases 1 (determination of coefficients $\beta, \lambda, \mathrm{k}_{\mathrm{o}}$ ), 3 (determination of coefficients $\beta, \lambda, \mathrm{h}$ ), 4 (determination of coefficients $\beta, \lambda, \mathrm{c}$ ) , 6 (determination of coefficients $\beta, \mathrm{c}, \mathrm{k}_{\mathbf{o}}$ ), 7 (determination of coefficients $\beta, \mathrm{h}, \mathrm{k}_{\mathbf{o}}$ ), and 8 (determination of coefficients $\beta, \rho, \mathrm{c}$ ).

Property 1 (Case 1).- For any data $\mathrm{q}_{\mathrm{o}}>0, \mathrm{~T}_{\mathrm{f}}>\mathrm{T}_{\mathrm{o}}, \delta>-1$ and coefficients $\rho>0, \mathrm{~h}>0, \mathrm{c}>0$ of the phase-change material the problem of determining the unknown coefficients $\beta, \lambda$ and $\mathrm{k}_{\mathrm{o}}$ has always a solution which is given by (2), (3) and

$$
\begin{align*}
\beta & =\delta \Phi(\lambda)  \tag{12}\\
\mathbf{k}_{\mathbf{o}} & =\frac{4 \mathrm{q}_{0}^{2}}{\rho \mathbf{c}\left(\mathbf{T}_{\mathbf{f}}-\mathrm{T}_{\mathbf{o}}\right)^{2}} \frac{\Phi^{2}(\lambda)}{\left(\Phi^{\prime}(0)\right)^{2}} \tag{13}
\end{align*}
$$

where $\lambda$ is the unique solution of the equation

$$
\begin{equation*}
\mathrm{F}_{1}(\mathrm{x})=\frac{2}{\operatorname{Ste}} \mathrm{~F}_{2}(\mathrm{x}), \mathrm{x}>0 \tag{14}
\end{equation*}
$$

Proof.- The equations (4) and (6) give us the expression (12) for $\beta$ and (13) for $\mathrm{k}_{\mathrm{o}}$. From equation (5), we obtain the equation (14) which has a unique solution $\lambda>0$ taking into account the properties (11) corresponding to the functions $\mathrm{F}_{1}$ and $\mathrm{F}_{2}$.

Property 2 (Case 3).- The necessary and sufficient condition with $\beta, \lambda$ and h unknowns to obtain a unique solution is that data $\mathrm{q}_{0}>0, \mathrm{~T}_{\mathrm{f}}>\mathrm{T}_{\mathrm{o}}, \delta>-1$ and coefficients $\mathrm{k}_{\mathrm{O}}>0, \rho>0, \mathrm{c}>0$ of the phase-change material verify condition ( $\mathrm{R}_{1}$ ). In such a case, the solution is given by (2), (3), $\beta$ is given by (12) and

$$
\begin{equation*}
\mathrm{h}=\frac{\mathrm{c}\left(\mathrm{~T}_{\mathrm{f}}-\mathrm{T}_{\mathrm{o}}\right)}{2} \frac{\Phi^{\prime}(\lambda)}{\lambda \Phi(\lambda)}[1+\delta \Phi(\lambda)] \tag{15}
\end{equation*}
$$

where $\lambda$ is the unique solution of the equation

$$
\begin{equation*}
\Phi(\mathrm{x})=\frac{\left(\mathrm{T}_{\mathrm{f}}-\mathrm{T}_{\mathrm{o}}\right)}{2 \mathrm{q}_{\mathrm{o}}} \Phi^{\prime}(0) \sqrt{\rho \mathrm{ck} \mathrm{k}_{\mathrm{o}}}, \mathrm{x}>0 . \tag{16}
\end{equation*}
$$

Proof.- The equations (4) and (5) give us the expression (12) for $\beta$ and (15) for $h$. From equation (6)
and properties (11) for the function $\Phi$, we obtain for $\lambda$ the equation (16) which has a unique solution $\lambda>0$ if and only if

$$
\frac{\left(\mathrm{T}_{\mathrm{f}}-\mathrm{T}_{\mathrm{o}}\right)}{2 \mathrm{q}_{\mathrm{o}}} \Phi^{\prime}(0) \sqrt{\rho \mathrm{c} \mathrm{k}_{\mathrm{o}}}<1
$$

that is condition ( $R_{1}$ ).
Property 3 (Case 4).- The necessary and sufficient condition with $\beta, \lambda$ and c unknowns to obtain a unique solution is that data $\mathrm{q}_{\mathrm{o}}>0, \mathrm{~T}_{\mathrm{f}}>\mathrm{T}_{\mathrm{o}}, \delta>-1$ and coefficients $\mathrm{k}_{\mathrm{o}}>0, \mathrm{~h}>0, \rho>0$ of the phase-change material verify condition ( $\mathrm{R}_{2}$ ). In such a case, the solution is given by (2), (3), $\beta$ is given by (12), and

$$
\begin{equation*}
\mathrm{c}=\frac{4 \mathrm{q}_{\mathrm{o}}^{2}}{\rho \mathrm{k}_{\mathrm{o}}\left(\mathrm{~T}_{\mathrm{f}}-\mathrm{T}_{\mathrm{o}}\right)^{2}} \frac{\Phi^{2}(\lambda)}{\left(\Phi^{\prime}(0)\right)^{2}} \tag{17}
\end{equation*}
$$

and $\lambda>0$ is the unique solution of the equation :

$$
\begin{equation*}
\mathrm{F}_{3}(\mathrm{x})=\frac{\rho \mathrm{h} \mathrm{k}_{\mathrm{o}}\left(\mathrm{~T}_{\mathrm{f}}-\mathrm{T}_{\mathrm{o}}\right)}{2 \mathrm{q}_{\mathrm{o}}^{2}}\left(\Phi^{\prime}(0)\right)^{2} \mathrm{~F}_{6}(\mathrm{x}), \mathrm{x}>0 \tag{18}
\end{equation*}
$$

Proof.- The equations (4) and (6) give us the expression (12) for $\beta$ and (17) for c respectively. From (5), (17), the properties of functions $\mathrm{F}_{3}$ and $\mathrm{F}_{6}$, given in (11), we obtain the equation (18) which has a unique solution $\lambda>0$ if and only if

$$
\begin{equation*}
\mathrm{F}_{3}\left(0^{+}\right)=\Phi^{\prime}(0)>\frac{\rho \mathrm{h} \mathrm{k}_{\mathrm{o}}\left(\mathrm{~T}_{\mathrm{f}}-\mathrm{T}_{o}\right)}{2 \mathrm{q}_{o}^{2}} \mathrm{~F}_{6}\left(0^{+}\right) \tag{19}
\end{equation*}
$$

i.e. condition ( $\mathrm{R}_{2}$ ).

Property 4 (Case 6).- The necessary and sufficient condition with $\beta, \mathrm{k}_{\mathrm{o}}$ and $\mathbf{c}$ unknowns to obtain a unique solution is that data $q_{0}>0, \mathrm{~T}_{\mathrm{f}}>\mathrm{T}_{\mathrm{o}}, \sigma>0, \delta>-1$ and coefficients $\mathrm{h}>0, \rho>0$ of the phase-change material verify condition $\left(R_{3}\right)$. In such a case, the solution is given by (2), $\beta$ is given by (12) and

$$
\begin{align*}
& \mathrm{k}_{\mathrm{o}}=\frac{2 \sigma \mathrm{q}_{\mathrm{o}}}{\mathrm{~T}_{\mathrm{f}}-\mathrm{T}_{\mathrm{o}}} \frac{\Phi(\lambda)}{\lambda \Phi^{\prime}(0)}  \tag{20}\\
& \mathrm{c}=\frac{2 \mathrm{q}_{\mathrm{o}}}{\rho \sigma\left(\mathrm{~T}_{\mathrm{f}}-\mathrm{T}_{\mathrm{o}}\right)} \frac{\lambda \Phi(\lambda)}{\Phi^{\prime}(0)} \tag{21}
\end{align*}
$$

where $\lambda>0$ is the unique solution of the equation :

$$
\begin{equation*}
\mathrm{F}_{3}(\mathrm{x})=\frac{\rho \mathrm{h} \sigma}{\mathrm{q}_{0}} \Phi^{\prime}(0) \quad, \mathrm{x}>0 \tag{22}
\end{equation*}
$$

Proof.- The expression for $\beta$ is given from equation (4). Owing to $\sigma$ is known we get

$$
\begin{equation*}
\lambda=\sigma \sqrt{\frac{\rho \mathbf{c}}{\mathrm{k}_{\mathbf{o}}}} \tag{23}
\end{equation*}
$$

i.e.

$$
\begin{equation*}
\mathrm{c}=\frac{\lambda^{2} \mathbf{k}_{\mathrm{o}}}{\rho \sigma^{2}} \tag{24}
\end{equation*}
$$

From (24) and the equation (6) we obtain the expression (20) for $\mathbf{k}_{\mathrm{o}}$. Then, by using (20) and (24) we have (21). Now, taking into account the properties of the functions $F_{3}$ and $\Phi$ in (11), the equation (5) gives us the equation (22) for $\lambda$, which has a unique solution $\lambda>0$ if and only if

$$
\begin{equation*}
\mathrm{F}_{3}\left(0^{+}\right)=\Phi^{\prime}(0)>\frac{\rho \mathrm{h} \sigma}{\mathrm{q}_{0}} \Phi^{\prime}(0) \tag{25}
\end{equation*}
$$

i.e. condition ( $\mathrm{R}_{3}$ ).

Property 5 (Case 7).- For any data $\mathrm{q}_{\mathrm{o}}>0, \mathrm{~T}_{\mathrm{f}}>\mathrm{T}_{\mathrm{o}}, \sigma>0, \delta>-1$ and coefficients $\rho>0, \mathrm{c}>0$ of the phase-change material the problem of determining the unknown coefficients $\beta, \mathrm{k}_{\mathrm{o}}$ and h has always a solution which is given by (2), $\beta$ is given by (12), h is given by (15), and

$$
\begin{equation*}
\mathrm{k}_{\mathrm{o}}=\frac{\rho \mathrm{c} \sigma^{2}}{\lambda^{2}} \tag{26}
\end{equation*}
$$

where $\lambda>0$ is the unique solution of the equation

$$
\begin{equation*}
\mathrm{F}_{4}(\mathrm{x})=\frac{\rho \mathrm{c} \sigma\left(\mathrm{~T}_{\mathrm{f}}-\mathrm{T}_{\mathrm{o}}\right)}{2 \mathrm{q}_{\mathrm{o}}} \Phi^{\prime}(0), \mathrm{x}>0 \tag{27}
\end{equation*}
$$

Proof.- The equations (4) and (5) give us the expression (12) for $\beta$ and (15) for h. From (3) we obtain the expression (26) for $k_{0}$. From equation (6), we obtain for $\lambda$ the equation (27) which has a unique solution $\lambda>0$ taking into account the properties corresponding to the functions $F_{4}$ and $\Phi$, given in (11).

Property 6 (Case 8).- The necessary and sufficient condition with $\beta, \rho$ and $c$ unknowns to obtain a unique solution is that data $\mathrm{q}_{\mathrm{o}}>0, \mathrm{~T}_{\mathrm{f}}>\mathrm{T}_{\mathrm{o}}, \sigma>0, \delta>-1$ and coefficients $\mathrm{k}_{\mathrm{o}}>0, \mathrm{~h}>0$ of the phase-change material verify condition $\left(R_{4}\right)$. In such a case. the solution is given by (2), $\beta$ is given by (12) and

$$
\begin{align*}
& \mathrm{c}=\frac{2 \mathrm{~h}}{\mathrm{~T}_{\mathrm{f}}-\mathrm{T}_{\mathrm{o}}} \frac{\lambda \Phi(\lambda)}{\Phi^{\prime}(\lambda)} \frac{1}{1+\delta \Phi(\lambda)}  \tag{28}\\
& \rho=\frac{\lambda \mathrm{k}_{\mathrm{o}}\left(\mathrm{~T}_{\mathrm{f}}-\mathrm{T}_{\mathrm{o}}\right)}{2 \mathrm{~h} \sigma^{2}} \frac{\Phi^{\prime}(\lambda)[1+\delta \Phi(\lambda)]}{\Phi(\lambda)} \tag{29}
\end{align*}
$$

and $\lambda>0$ is the unique solution of the equation

$$
\begin{equation*}
\mathrm{F}_{5}(\mathrm{x})=\frac{\mathrm{k}_{\mathrm{o}}\left(\mathrm{~T}_{\mathrm{f}}-\mathrm{T}_{\mathrm{o}}\right)}{2 \sigma \mathrm{q}_{\mathrm{o}}} \Phi^{\prime}(0), \mathrm{x}>0 \tag{30}
\end{equation*}
$$

Proof.- The expression for $\beta$ is given (12) from equation (4). From (5), we obtain the expression (27). Owing to (23) and (28) we deduce (29). Then, from equation (6) we have, for $\lambda$, the equation (30) which has a unique solution $\lambda>0$ if and only if $\mathrm{k}_{\mathrm{o}}\left(\mathrm{T}_{\mathrm{f}}-\mathrm{T}_{\mathrm{o}}\right) \Phi^{\prime}(0) / 2 \sigma \mathrm{q}_{\mathrm{o}}<\Phi^{\prime}(0)$, that is condition ( $\mathrm{R}_{4}$ ).

Now, we shall give in Table 1, case by case, the formulae of the unknown thermal coefficients and the restriction for data in order to obtain the solution of the corresponding problem.

TABLE 1. (Continued)

## Acknowledgements

This paper was partially sponsored by CONICET (Argentina). This finantial support was granted to the project \# 4798 "Free Boundary Problems for the Heat-Diffusion Equation" (GIFLA).

## Nomenclature

c specific heat, $\left[\mathrm{J} / \mathrm{Kg}{ }^{\circ} \mathrm{K}\right]$,
erf error function
$\mathrm{F}_{\mathrm{i}}$ real function ( $\mathrm{i}=1, \ldots, 6$ )
$h$ latent heat of fusion, $[J / K g]$,
k thermal conductivity, $\left[\mathrm{W} \mathrm{m} /\left(\mathrm{m}^{2}{ }^{\circ} \mathrm{K}\right)\right], \mathrm{k}_{\mathrm{o}}=\mathrm{k}\left(\mathrm{T}_{\mathrm{o}}\right)$ reference thermal conductivity,
$\mathrm{q}_{0}$ coefficient which characterizes the heat flux on the fixed face $\mathrm{x}=0,\left[\mathrm{Ws} / \mathrm{m}^{2}\right]$,
$s$ position of phase change location, $[\mathrm{m}]$,
Ste Stefan number, $\frac{c\left(T_{f}-T_{0}\right)}{h}$,
t time variable, $[\mathrm{s}]$,
$T$ temperature of the solid phase, $\left[{ }^{K} K\right], T_{o}$ (temperature on the fixed face $\mathrm{x}=0$ ),
$\mathrm{T}_{\mathrm{f}}$ phase-change temperature, $\left[{ }^{\circ} \mathrm{K}\right]$,
x spatial variable, $[\mathrm{m}]$,
Greek symbols :
$\alpha_{o}$ reference thermal diffusivity, $\frac{\mathrm{k}_{\mathrm{o}}}{\rho \mathrm{c}},\left[\mathrm{m}^{2} / \mathrm{s}\right]$,
$\beta$ coefficient in $\mathrm{k}(\mathrm{T})=\mathrm{k}_{\mathrm{o}}\left[1+\beta\left(\mathrm{T}-\mathrm{T}_{\mathrm{o}}\right) /\left(\mathrm{T}_{\mathbf{f}}-\mathrm{T}_{\mathrm{o}}\right)\right]$,
$\delta, \lambda$ dimensionless parameters
$\Phi$ error modified function
$\sigma \quad$ coefficient which characterizes the moving boundary, $[\mathrm{m} / \sqrt{\mathrm{s}}]$,
$\rho \quad$ mass density, $\left[\mathrm{Kg} / \mathrm{m}^{3}\right]$,
